APR 22 2002

Requester's Full Name: Urszula Cegielnik Examiner #: 77064 Date: 4/22/02
 Art Unit: 3712 Phone Number 304 5806 Serial Number: 09 174 868
 Mail Box and Bldg/Room Location: CP2 10C02 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

 Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Elevated Game Call with Attachment Feature
 Inventors (please provide full names): John Musacchia, Jr.

Earliest Priority Filing Date: 10/19/1998

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

A one-piece game call and elevating device, wherein sound is produced, the game call having a scratch surface separated from a sound emanating surface, the sound emanating surface having apertures through which the sound in the game call escapes the game call; and a body attachment assembly, connected to the elevating device, designed to releasably attach the game call and elevating device to the body of a user of the hunting device; the elevating device elevating the sound emanating surface of the game call such that the sound emanating surface is not in contact with a user when the body attachment assembly is attached to the body of a user, thereby providing an unencumbered path for the sound to escape the game call and reach ambient.

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 20010018311	A1		13	A63H-005/00	

Abstract (Basic): US 20010018311 A1

NOVELTY - A strap (78) is used in the releasable attachment of the
game call device (10) to the body of the user. The game call portion
wherein sounds are produced has a sound emanating surface.

USE - For use in producing sounds and as a hunting device.

ADVANTAGE - Lesser manufacturing cost but with superior acoustics
since game call portion and platform portion has legs that are both
designed to maximize the sound produced by the game call.

DESCRIPTION OF DRAWING(S) - The figure shows a perspective view of
the game call.

Game call device (10)

Abstract (Basic): US 5988469 A

NOVELTY - Multiple elastic protrusions (70) are formed around
central opening (66), in top face (22) of base (12). A strap (34) which
has snap buckle (40), is attached to base, so that holder is securable

to user's limb. An elastic band which extends across top face, holds item against protrusions.

DETAILED DESCRIPTION - One end of safety strap (34) is attached to base and other end is securable via hook and loop fastener to base, in such a way that strap extends across top face of base. A tether (60) which is attached to base, is coupled via hook (62) to the belt or belt loop of user.

USE - For securing animal call imitating device used by hunter, pilot's clipboard, note pad, tools, etc., to user's thigh.

ADVANTAGE - The provision of elastic protrusions, supports and acoustically isolates the call imitating device so that sound of call is not dampened. The central opening also helps in propagation of sound. The straps retain the holder against user's limb so that hands are free for performing other operation.

DESCRIPTION OF DRAWING(S) - The figure shows perspective view of holder.

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 5607091	A	11	A45C-013/30		

US 5607091 A 11 A45C-013/30

Abstract (Basic): US 5607091 A

The game call holder comprises a platform having top and bottom surfaces and provided with an aperture through it, legs depending from the platform and a striker and a flexible tether, the tether having opposing portions respectively attached to the striker and the platform. It also has a retainer element including a resilient member having a stretch bridging the platform aperture. The retainer element stretch may be deflected under tension to captively retain a game call having a lower sound emanating surface disposed over the platform aperture.

It also has a body attachment assembly carried by the platform and encirclable about a limb of a user's body to secure the platform legs

against the body limb. The game call lower sound emanating surface is retained spaced from the body limb.

... sells for \$7.95.

Tom Gaskins (Box 95, Palmdale, FL 33944) introduced the Tom Gaskins Turkey Call in 1946. Since that time thousands have been produced, each one individually made and tuned by Gaskins. It is a **scratch box made of Southern red cedar and features one-piece construction.** Striker and chalk are conveniently stored within the body of the call. It produces a wide variety of realistic tones and has good volume.

CA 1297325	C	19920317				199217

Priority Applications (No Type Date): US 88201775 A 19880602

Abstract (Basic): US 4950198 A

The game call includes a cylindrical body, vibratable diaphragm, split ring for fastening the diaphragm to the body and tubular bell attachable to the body for amplifying and enhancing the sound produced by the diaphragm. The body includes an inlet end surface having a conical recessed portion, an outlet end surface having two planar surface portions angled w.r.t. one another, and an air passage extending between the inlet and outlet end surfaces.

The air passage has a flared outlet opening at the outlet end surface. The diaphragm is fastened in slightly stretched fashion to the outlet end surface such that it at least covers the flared outlet opening. The diaphragm has a seam in proximate relationship to a periphery portion of the flared outlet portion, along which air from the air passage is permitted to escape.

USE - Game which simulates calls made by certain types of wildlife e.g. fowls. (7pp Dwg. No. 3/8)

Abstract (Basic): GB 2160759 A

Article has a unit adjacent the cloth and an activator for starting the unit. The article is partic. a garment and has a graphic pattern on the fabric oriented to the activator. The unit pref. produces at least a musical tube, and the actuator is a switch with an actuating button.

The button may be located against the fabric to be pressed from the exterior, or may be between the switch and the wearer's body. The garment pref. has a pocket formed by two layers of fabric, and the unit and actuator are enclosed in a water- and heat-resistant sealed envelope formed by two thin plastics sheets sealed peripherally and

having a member for attachment to the fabric.

Abstract (Basic): US 4407091 A

The rattle for infants for attachment to the wrist resembles a wrist watch in appearance. It includes a casing of sheet material containing a quantity of small pebble-like translucent pieces of multi-faceted hard plastic or glass rattling around creating the noise attributed to an infant's rattle.

Attachment by straps to the wrist not only militates against loss but also the infant's arm movements automatically effects the desired noise making.

English Abstract

An augmented musical toy (10) includes a housing (11) defining a semicircular handle (12) and generally planar body (13). A hollow tube (14) is supported upon the body and includes a kazoo sounding unit (30). The body further includes a pair of generally cylindrical sounding cups (40, 50), having disposed therein quantities of moldable plastic material (45, 55). In one embodiment the sounding cups are closed end while in an alternate embodiment a small air passage (146, 156) coupling the cup interiors to the kazoo sounding tube are provided. A flexible tube (15) is coupled between the kazoo and a user mouthpiece (16). In its anticipated use, the user produces sounds using the kazoo sounding unit while augmenting the sounds produced by inserting one or more fingers into each of the sounding cups and imbedding them into the plastic material therein.

ABSTRACT EP 671194 A3

A musical toy in which tappers on the ends of swinging bodies can be swung up and kept upswung without using any springs; space for spring mounting is thereby made unnecessary and the toy can be made small; the manufacturing process can be simplified and resulting mass production benefits and cost reductions can be achieved, and which can operate stably over a long period of time. There are provided a toy body 7, a sound producing body 5 and a control device 54, and the toy body 7 comprises first permanent magnets 23a and 23b and swinging bodies 9a and 9b mounted in the vicinity of the first permanent magnets 23a and 23b. The swinging bodies 9a and 9b comprise tappers 11a and 11b for striking the sound producing body 5 and acting parts for magnetically interacting with the first permanent magnets 23a and 23b and generating a swinging force; the acting part comprises second permanent magnets 31a and 31b for swinging the tappers up and coils 29a and 29b for swinging down the upswung tappers against the resistance of the second permanent magnets 31a and 31b. The control device 54 comprises rhythm signal generating means 57 for generating a rhythm signal and by supplying this rhythm signal to the coils 29a and 29b causes the swinging bodies 9a and 9b to swing according to the rhythm signal so that the tappers 11a and 11b strike the sound producing bodies 5. (see image in original document)

ABSTRACT EP 390101 A2

The sound-box device comprises a container (1), an electronic control element (15) which is arranged inside the container (1) and is adapted to produce a plurality of electric signals which can be transduced into sound signals which are ordered according to at least one sound sequence, at least one sensor element (35) which is arranged on the internal surface of the container (1), is connected to the electronic control unit (15) and adapted to be actuated on a corresponding symbol (10) shown on the outer surface of the container (1) for selecting the sound sequence, a loudspeaker (29) accommodated inside the container (1) for the emission of the sound signals, means for supplying electric power (21) to the electronic control element (15) and to the speaker (29).

English Abstract

A noisemaking device having a body (11), a top aperture (21); a bottom aperture (19); an internal noise module (18) comprising a reed (20). Noise module (18) has a cylindrical external wall (22) which is secured by the body (11) within an air passage (17). The noise module (18) is positioned along and gripped by a narrow region (14) of body (11) in a region proximate the bottom end (16) of body (11). There is an air-tight seal (25) between the external wall (22) of the noise module (18) and wall (15) of the body (11). An internal sound chamber (26) between the noise module (18) and the top aperture (21) amplifies the noise emitted by the noise module (18).

English Abstract

The glove (10) is provided with a sound generator (12) and at least one switch (14) for producing a signal activating the sound generator (12). In one embodiment, the sound generator (12) is an electronic sound chip playing back digitized sounds stored in a non-volatile memory, and different sounds are produced in response to depressing different switches indicative of a position of the glove (10). The sound may be produced in response to pressure contact, the glove shape or position (e.g. wrist or finger flexion) or electrical contact with an identifiable object.

English Abstract

An improved noise making device (10) particularly suited for use in stadiums, arenas and the like comprises a flexible, planar member or "whooping plate" (12), and a handle (14), both preferably comprised of plastic, the ends of the handle (14) being joined to the ends of the planar member (12) with the central section of the handle bowed outwardly from the planar member, such that when the handle is gripped and thrust forward and backward, the planar member bows inwardly and outwardly, thereby generating a loud noise. Suitable indicia, such as a team logo or advertising message, may be imprinted on the outer surface of the planar member.

English Abstract

The present invention acts as a container for food or beverages and may be converted into an apparatus to enhance an applause or boo. One

embodiment is an elongated resilient member (20) attached to a container (110). The elongated resilient member is in close proximity to the container such that when the elongated resilient member is pulled away (M) from the container and released the elongated resilient member snaps back making an audible sound. Another embodiment is an apparatus for holding a beverage container. The apparatus has a top (48), a bottom (44), and at least two sidewall sections (58, 59) fixedly attached. By detaching the sidewall sections in at least one place the sidewall sections may be open and closed such that the sidewall sections hit each other to make an audible sound.
